#### About Consol

Consol New Zealand is a full member of the Solar Industries Association and is accredited for supply and installation.

The Consol system is both an AS/NZS 2712:2007 approved (see Appendix 1) and an Energy Efficiency & Conservation Authority-approved (EECA) system.

#### **Product Description**

This system is an evacuated tube system coupled to a stainless-steel cylinder with a valve vented open loop circuit.

The panel is 2450mm wide by 1890mm high. It is a lightweight panel at 20kg/m<sup>2</sup> and is fixed to the roof with rubber blocks to create an air space of 20mm between the frame and the roof.

The manifold and frame for mounting is manufactured from powder coated aluminium, while the tubes are borosilicate glass, and the fixings are galvanised.

All pipework on the solar circuit is 15mm copper insulated with 13mm wall Armaflex FR. All external insulation is wrapped to protect it from the elements.

Legionella is controlled by pumped circuit and auxiliary heating.

Consol solar systems are to be installed only by accredited installers.

#### Pump Controller

The pump controller runs the system and measures temperatures at the cylinder and manifold via temperature probes. This enables the controller to decide the optimal time to start the pump to transfer the heated fluid from the manifold to the cylinder. Power supply to the controller and pump are not to be on a circuit that is controlled by the electricity supplier.

The pump controller protects the system against freezing and overheating. The operation instructions for the controller clearly outline the functions and settings of the system and need to be used in conjunction with the set up and future operation of the system.

The controller for this system requires three probes for accurate operation. Probe location is outlined in the controller operation and installation manual. Probe pockets are to be dry before inserted.

A separate instruction manual for the controller is supplied.

#### **Supplementary Heating Controller**

The controller manual also outlines the programming of the timing heating parameters necessary for efficient operation and should be followed.

This is very important as the cylinder temperature must reach 60 degrees once a day to control the growth of legionella which is harmful to human health.

#### <u>Pump</u>

The pump is the means of transferring the heated fluid from the manifold to the cylinder and the cooler fluid from the cylinder to the manifold to be heated. The pump is operated by the controller and needs a continuous supply of power to allow frost protection of the system. This should be prominently displayed. The pump should draw the coldest water from the bottom of the tank and return it at a higher point using the connection points recommended by the manufacturer.

When mounted securely the pump must be above the cylinder safe tray in case of leakage. An isolation value is to be located either side of the pump to enable ease of removal for servicing.

The pump has three settings and a flow meter is to be used to enable the correct flow rate (30 litres/hr/m<sup>2</sup> of collector area). The controller manual outlines the settings for the pump and controller operation and changing these settings will affect the performance of the system.

#### <u>Valves</u>

The valves associated with the solar system are necessary for protection, operation, and maintenance of the system. The necessary valves are outlined in the schematic drawings of the plumbing diagrams. If draining the cylinder for maintenance of valves disconnect all electrical elements to the cylinder.

- Pressure created by the system will be relieved through the cold-water expansion and temperature pressure relief on the cylinder. Easing of valves is to be carried out by a registered craftsman plumber. Tempering valve is necessary to reduce the water to a safe temperature.
- Air relief valve at the highest point of the pipework. Use only Caleffi solar air relief 250031, rated to 180 degrees Celsius and 10 Bar.
- Non-return valve on the inlet line and outlet line of the collector, to and from the cylinder.
- Two shut off valves either side of the pump.

#### **Pipeline and Insulation**

- Use copper pipeline no less than 15mm.
- Use long radius bends to reduce resistance to flow rates. Pipework is to be flushed of foreign material.
- Pipework to be pressure tested to 1.5 times the maximum working pressure prior to insulating.
- Insulation of the solar pipework is to be Armaflex FR.
- External insulation to be foil covered to reduce degradation from the elements.
- Length of pipework should be kept to a minimum to reduce the time for completing fluid transfer.
- Long pipe runs should incorporate expansion loops, horizontally formed to avoid air locks.
- Insulation material, insulation thickness, and operation method should comply with regional regulation.

#### Water Tank

The Coopers solar ready cylinder is constructed of Duplex stainless steel and is an integral part of the solar package.

The cylinder comes with the temperature and pressure relief valve that must be installed. Cylinders will be placed on a safe tray with a 40mm waste if in a location that leakage could cause damage to property.

#### **Technical Parameters**

Water heater model number: Consol 30-58-1800 with the MP 300 cylinder

Date of AS/NZS 2712:2007 compliance approval: 2007

Manifold: unitary aluminium alloy manifold
Thickness: 1.9mm
Material of bracket: aluminium allow 1.9mm
Material of heater pipe: T2 copper
Insulation material: rock wool
Thickness of rock wool: 96mm
Density of rock wool: 80kg/m <sup>3</sup>
Seal: silicon rubber
Hydraulic connections: copper pipe
Max. operation pressure 8 bar
Test pressure: 10 bar
Max. working temperature: 220°
Min. working temperature: -40°
Max. tilt angle: 45°
Min tilt angle: 15°
Thickness of water carrying tube: 0.8mm
Surface finish: powder coated
Permissible wind: 45m/s
Snow load: <0.6kpa

Collector inlet pipe insulation thickness	25mm	
Collector outlet pipe insulation material	Centurylon	
Collector outlet pipe insulation thickness	25mm	
Diameter of piping used (ID)	15mm	
Height of hot water draw-off port on side of	310	
cylinder from bottom of cylinder		
Height of inlet of dip tube connected to hot	5mm from bottom of cylinder	
water draw-off port if there is one		
General		
How does the system control stagnation	Controller is fitted with a high temperature	
events?	protection feature. When temperature reaches a set	
	temp the controller opens a valve on the inlet pipe	
	and shuts off the pump. When the tank temperature	
	lower to a set parameter temperature the function is	
	deactivated	

How does the system control freezing	Frost protection via insulation and programme in the
events?	controller to avoid freezing
What is the maximum temperature the Cylinder max. temperature is 90°C. The controller has	
cylinder can withstand? How do you control	a function to stop the cylinder heating at set
over-temperature within the cylinder?	temperature.

#### **Collector Schematic**

#### **Fixing**

Fixings are to be fastened through the top of the corrugations. The frame is to be set 20mm off the roof by way of rubber packers at the fixing points. Fixings are to be galvanised and securely fixed through the purlin into the roof truss.

Frame upright can be adjusted by related situation about the roof.

## INSTALLATION DETAILS CONSOL 'D' SERIES SOLAR COLLECTORS

CORRUGATED ROOFING PROFILE

## CORRUGATED PROFILE ROOFING

### PIPE PENETRATION FLASHING

MAXIMUM ROOF PITCH FOR THIS FLASHING 45" MINIMUM PITCH 10"

#### **Stand Mounting of Collector**

The stand mounted collector may be necessary where the roof is not at the correct inclination.

The customer should be advised that performance is reduced if the panel is not mounted at the correct inclination. The performance can be increased by adding extra tubes as an alternative to mounting on a stand.

#### **Plumbing Diagram**

#### **Connection of Controllers**

Installation and commissioning of the controller must be carried out by a **registered electrician** and **in accordance with the operation and instruction manual**. Care should be taken when wiring in the controller auxiliary heating where ripple control could disturb the operation of the system. The adjustment of controllers may adversely affect solar performance.

The controller controls the system components. It will operate the switching time of the cylinder and pump. There needs to be a continuous power supply to the controller as the freeze protection function is operated by the controller. This system operates with three temperature probes that are wired to the collector, cylinder, and controller. Placement of the sensors according to the wiring diagrams is important. Sensor cables are to be protected from degradation by weather and animals.

The controller is to be installed in a position that is accessible for servicing.

Connection to the mains is via a plug and is not to be hard wired.

Functions of the controller include:

- Temperature difference controlling
- Temperature control auxiliary heating

- Time controlled auxiliary heating
- Temperature control hot water circulation
- Anti-freezing protection
- High temperature protection

#### **Connection of Pump**

The pump in this direct system will draw the water from the low point of the cylinder, circulate it through the collector(s) and return the heated water at a higher point than the draw off point.

The pump used in this system is the WILO RS25/6.

The pump will be installed with isolation fittings either side that will allow forremoval for maintenance or replacement.

This pump is designed to produce the hydrostatic head that may not be suitable for every application.

The pump is wired into and operated by the system controlled.

The pump is to be mounted according to the manufacturer's instructions and according to the system layout diagrams.

The pump is fitted to the system by the installer and the wiring is carried out by the electrician.

#### **Connection of Cylinder**

The chosen cylinder for the Consol system is the Coopers mains pressure stainless steel solar ready MP series.

The cylinder comes standard with element and thermostat and temperature/pressure relief valves set to 90°C and 850kpa (the cylinder has a manual resettable cut out button set at 85 degrees).

Cylinders are to be restrained as per the Building Code. Thermostats should be set to 55°C or to 45°C for the elderly and child facilities.

The cylinder is to be filled and vented prior to being energised by power or solar.

The cylinder is the storage for the water heated via solar gain and is to be correctly sized according to the water usage and the size of the collector. The cylinder has an electrical element to back up the solar. The electrical element is wired to and is controlled by the controller.

**Compliance Certificate** 

Appliance:	Consol NZ Ltd 58-1800 tube SHW systems
Standard Applied:	AS/NZS2712:2007
Full Report Ref.:	10/2229, 10/2150

Based on the information and results obtained during testing and assessment, the Consol NZ Ltd solar hot water systems comply with the type testing requirements of AS/NZS2712:2007. Systems covered by this certificate are listed below.

This compliance certificate relates only to the product sample tested. Any modifications to the product may invalidate the compliance results.

Our reports 10/2229 and 10/2150 gives details of the appliance, the assessment and the results obtained.

This report:
